

Minimum Standards for local climate-smart Disaster Risk Reduction – *enabling integration of local capacities into national climate adaptation strategies*

This policy brief explores how local disaster risk reduction (DRR) can go beyond business-as-usual to become “climate smart”, and in the process make a significant contribution to adapting to climate change.

Climate change is increasing the risk of extreme events and disasters. DRR can make an important contribution to national- and local-level efforts to adapt to a changing climate.¹ Yet in many cases, these opportunities for reducing the risk of extreme events and adapting to climate change are not being used effectively in policy and planning. To be effective, disaster risk reduction, on all levels, must consciously incorporate scenarios of changing risks, rather than simply responding to disaster patterns of the past.

There is a need to identify what is the *minimum* that communities should do to ensure DRR activities are climate smart, and how governments and civil society can create an enabling environment to support and scale-up those efforts.

Pilot projects across the world have shown that addressing changing climate and disaster risks at the local level is highly effective for building resilience. Strong capacities and robust institutions at the community level can maximize the impacts of climate-smart disaster risk reduction; yet for this to happen, it is essential that communities and the organizations supporting them all know how to integrate changing risks into their activities.

Why climate-smart Minimum Standards?

The reason for Minimum Standards is presented as a living document in Annex 1: to set a standard for ensuring that local action to reduce disaster risk is climate smart – and in a way that does not aim for impossibly idealized solutions, but for *practical* approaches that are achievable by communities with relatively limited support.

¹ IPCC, 2012: *Managing the Risks of Extreme Events and Disasters to Advance Climate Change Adaptation (SREX)*. SREX findings have been formally approved by all UN member governments.

Key messages

The Minimum Standards:

- Will enable national and local actors – policy-makers, knowledge centres and planners – better understand how to support communities increasingly at risk from disasters.
- Will assist communities and civil society organizations in defining what are the *minimum* actions that community-level disaster risk reduction programmes need to consider in order to be climate smart.
- Will help ensure that local DRR action is climate smart in a way that does not aim for the idealized solutions, but practical approaches that are achievable by many communities with relatively limited support.
- Can be widely applied across contexts and sectors where disaster risk reduction policy and programming take place.
- Reflect local needs and demonstrate how these can be supported by civil society, knowledge centres and governments.
- Provide guidance for how to build community resilience across the key themes of information flow and capacity development, project planning and implementation, monitoring, evaluation and learning, and awareness raising and policy dialogue.

As such, these Minimum Standards serve as an *essential bridge* between national climate policy and local capacities for DRR. Many national climate change adaptation plans already highlight the need to address the rising risk of extreme events and disasters. Many also acknowledge the essential role of local communities in addressing the changing risks that often hit the most vulnerable people in communities.

Using these Minimum Standards, *national* actors can now effectively incorporate local community action on DRR into national adaptation strategies:

- The Minimum Standards ensure DRR goes beyond business-as-usual and really addresses changing risks. If the standards are met, the actions are climate smart and contribute to climate change adaptation.
- National strategies can be applied on a larger scale, in the knowledge that the standards are realistic and achievable.

For *local* actors and their counterparts in local government, knowledge centres and civil society organizations, the Minimum Standards are intended as a practical tool, allowing them to integrate changing risks into their work. Hence, they also include a guidance note for civil society and governments to support communities adopting climate-smart Minimum Standards for DRR.

What are climate-smart Minimum Standards?

The Minimum Standards presented in Annex 1 outline actions at the community level that ensure DRR actions are climate smart. They are based on extensive local experience and consultation (Box 1), including lessons learned during the first years of the Partners for Resilience (PfR) programme, which focuses on local-level, climate-smart DRR. The PfR, five Netherlands humanitarian, development and environmental organizations, supported by the Dutch Ministry of Foreign Affairs, formed their alliance in 2011 to reduce the impact of hazards on vulnerable communities and generate lessons on strengthening community resilience in nine countries: Ethiopia, Guatemala, India, Indonesia, Kenya, Mali, Nicaragua, the Philippines and Uganda.²

In the table outlining “Minimum Standards for community”, climate-smart actions are organized into four themes:

- *Information flow and capacity development.* This includes knowledge and skills related to climate risks and their link to disasters and development. For example, “climate-smart communities know how to apply climate and weather information in planning local activities.”
- *Project planning and implementation.* This refers to conducting climate-smart risk assessments. For example “vulnerability and capacity assessments

² PfR also acknowledges crucial linkages between community-based climate-smart DRR activities and the management of the local *ecosystems*. “Ecosystem-smart minimum standards” – developed by PfR partner Wetlands International – will supplement climate-smart standards for community implementation of ecosystems-based DRR.

(VCA) and local- to national-level risk-assessments are in place and incorporate changing patterns of climate risk.”

- *Monitoring, evaluation and learning.* Key actions required to evaluate progress towards climate-smart policies and practices and learn from this process are outlined here, for example “meetings are held regularly to share lessons from the integration of climate variables into projects and programmes.”
- *Awareness raising and policy dialogue.* Strengthening collaboration and partnerships between stakeholders working on disaster management, climate change and development is central to this theme. In addition, actions by civil society are included to help government decision-makers at all levels reflect local needs.

In addition, a table defines Minimum Standards for civil society and governments helping communities become climate smart in their DRR. Taken together, these tables can help policy-makers determine when a *community*-level DRR intervention will be effective in addressing changing climate risks.

Next steps

The Minimum Standards are more than just aspirations. Over the coming years they will be applied and tested in wider PfR programming, and used in policy dialogue with national governments and other partners.

The Minimum Standards for climate-smart local disaster risk reduction remains a living document. We invite others – practitioners, scientists and policy-makers – to comment and contribute, use them in their work, and share experience at climatecentre@climatecentre.org.

Box 1: How were the Minimum Standards developed?

Faced with increasing pressure to deliver on a greater scale and wishing to empower communities and local organizations to become climate smart in their delivery of disaster risk reduction (DRR), practitioners working on DRR and climate change adaptation (CCA) around the world sought realistic standards that would guide these efforts. They also sought to provide clarity to policy-makers on what standards to set for local adaptation to climate change – increasingly acknowledged as a crucial component of national adaptation planning.

The Partners for Resilience (PfR) – the Netherlands Red Cross, the Red Cross Red Crescent Climate Centre, CARE International, Cordaid, Wetlands International, and their local counterparts – was the ideal testing ground for such concepts. An initial draft of Minimum Standards was developed in 2011, based on ideas and experiences in a range of prior initiatives.³ That draft formed the basis from which the current version of the Minimum Standards was developed.

In May 2012, a workshop was held in Kupang, Indonesia, to further develop the Minimum Standards. Over 40 participants attended, including global and regional PfR staff and decision-makers as well as representatives of the Indonesian government. The current draft of the Minimum Standards also reflect the recommendations of the 5th South-South Citizenry-Based Development Sub-Academy (SSCBDA) held immediately prior to the workshop on Minimum Standards and attended by over 160 people.⁴

During the one-day workshop, participants discussed:

- Why the Minimum Standards are needed, their purpose and objectives.
- What they would include.
- How they would be organized and presented for easy access and use.
- How they would be further developed.
- How to test and refine the Minimum Standards through PfR.

After presentations to set the Minimum Standards in context, participants revised the existing draft standards. They focused first on developing Minimum Standards at the community level, and then standards to support the resilience of communities by civil society, knowledge centres and governments. Discussion points included how to represent the key themes in the standards in a way applicable in multiple contexts, integrate different elements like the management of ecosystems, and strengthen community resilience

The Minimum Standards remain a work in progress, updated regularly based on inputs from PfR experience and others, and shared among organizations and in different policy arenas to support effective and sustainable policy and programmes for community resilience in a changing climate.

³ For example, Strengthening Climate Resilience (SCR), Climate Smart Disaster Risk Management (CSDRM) initiative, the Africa Climate Change Resilience Alliance (ACCRA), and the annual International Conferences on Community-based Adaptation.

⁴ The primary aim of the SSCBDA is to expand the capacity of organizations engaged in citizenry-based development-oriented DRR and CCA initiatives in the Asia-Pacific region so they can learn and exchange solutions and options.

Acknowledgements

This brief and the Minimum Standards it outlines have been developed in collaboration with many different people and organizations, including the PfR partners in Indonesia and Philippines, and the authors are extremely grateful to them for their assistance. Responsibility for any errors is the authors' alone.

ANNEX 1:

Minimum Standards for local climate-smart Disaster Risk Reduction

Climate change is increasing the risk of extreme events and disasters.³ The most vulnerable people in communities will be hit hardest. Disaster risk reduction can make an important contribution to national and local level efforts to adapt to a changing climate and strengthen the resilience of communities.

Many national climate change adaptation plans stress the need to address the rising risk of extreme events and disasters and also acknowledge the essential role of local communities in addressing these changing risks. Yet in many cases, opportunities for reducing the risk of extreme events and adapting to climate change are missed.

The **Minimum Standards for climate-smart disaster risk reduction serve as an essential bridge between national climate policy and local capacities for DRR.** The standards are not idealized solutions, but rather practical approaches to implementing climate-smart DRR activities in a way that is achievable by many communities with relatively limited external support.

Using these Minimum Standards, **national actors** can now effectively incorporate local community action on DRR into national adaptation strategies. The standards provide assurance that DRR goes beyond business as usual and truly addresses changing risks. If the Minimum Standards are met, local DRR actions are climate smart and contribute to climate change adaptation. What is more, the national strategies that consider these standards will be able to go to scale, knowing that they are realistic and achievable.

For **local actors**, and their counterparts in local governments and civil society organizations, the minimum standards are intended as a practical tool, allowing them to integrate changing climate risks into their efforts to support communities reduce risk to extreme events and disasters.

The minimum standards are based on ample local experience and consultation, including lessons learned during the first years of the Partners for Resilience⁴ programme, the largest programme of its kind focusing on local-level climate-smart DRR. Notably, **the standards are a living document** that will be discussed, tested, revised and validated through activities in nine countries of the Partners for Resilience program throughout the remainder of 2012 and into 2013, and hopefully beyond.

We welcome your feedback on the structure, content and overall utility of the minimum standards at climatecentre@climatecentre.org.

⁴ In 2011, five humanitarian, development and environment organizations, with support from the Dutch Ministry of Foreign Affairs, formed an alliance called “Partners for Resilience” (PfR) to reduce the impact of hazards on vulnerable communities in nine countries around the world and generate lessons on best practices for strengthening community resilience.

Minimum Standards for local climate-smart Disaster Risk Reduction (DRR)

Part I: Community level

This table presents standards that are intended to identify when community-level disaster risk reduction activities are climate-smart. In the table, actions listed as “climate aware” can be thought of as *first steps* to incorporating climate risk in DRR policy, planning and implementation. Actions depicted as “climate smart” are the *minimum actions* that can be realistically expected to ensure disaster risk reduction efforts at the community level address changing climate risks.

The table in Part II offers guidance for civil society organisations (CSOs), knowledge centres and government agencies to *support communities and create an enabling environment* for implementation of the Minimum Standards.

Theme	Minimum standards for community level	
	Climate aware	Climate smart
Information flow and capacity development	<ul style="list-style-type: none"> Community is aware that climate risks in the future are likely to be different from the past Community is aware of and understands locally available weather and climate information, including short-term and <i>seasonal</i> forecasts (where relevant) Community understands the risks it may face as a result of climate variability and climate change impacts, and the linkages to other external factors such as environmental degradation Community can identify its capacity development needs in relation to climate-smart disaster risk reduction 	<ul style="list-style-type: none"> Community can interpret relevant early warning information to develop early warning systems and action plans, and advocate its needs to key policy and decision makers To better manage climate-related disaster risk, community complements local practices and traditional knowledge with short-term and seasonal forecasts (where relevant) Community’s disaster risk management strategies are informed by training received on managing potential impacts of climate variability and climate change
Project planning and implementation	<ul style="list-style-type: none"> Community carries out vulnerability/risk assessments that reflect changing climate and disaster risks, and use the information to influence or develop local development and disaster preparedness and contingency plans 	<ul style="list-style-type: none"> Community regularly updates its risk assessments, baseline surveys, development plans, and disaster preparedness and contingency plans to ensure they reflect new climate-related forecast information and potential future climate conditions Community has an effective early warning system in place, or have rigorous plans for how to make use of publicly disseminated seasonal forecasts and warning messages Community members can identify ways to adapt or change existing livelihood practices to build resilience to changing climate risks
Monitoring, evaluation and learning	<ul style="list-style-type: none"> Community understands the importance of monitoring, evaluation and learning in relation to changing climate and disaster risk 	<ul style="list-style-type: none"> Community monitors and evaluates the impacts of climate variability and climate change on disaster patterns, livelihoods and health over time, and influence/revise local plans accordingly Community updates community action plans based on the result of monitoring and evaluation activities (linked to implementation)

Theme	Minimum standards for community level	
	Climate aware	Climate smart
Awareness raising and policy dialogue	<ul style="list-style-type: none"> Community is able to identify advocacy needs towards appropriate climate-related authorities and stakeholders (e.g. farmer groups, agricultural extension services, meteorological services, water management and health authorities, policy makers etc.) Community members participate, where possible, in capacity building events with local government, knowledge centres and relevant institutional authorities Communities have a functional and representative system of community organisation that takes into account the special needs of different at-risk populations/groups 	<ul style="list-style-type: none"> Community has an active channel to enable a relationship with their meteorological office and relevant institutional focal points responsible for early warning systems and message dissemination Community representatives can clearly and effectively communicate support needs (e.g. access to information, capacity building, etc) to climate change networks and government representatives/focal points at various levels Community systematically collects evidence on climate-smart community disaster risk reduction practice, so that such evidence can inform improved future practice as well as advocacy Communities are aware of funding opportunities related to climate-smart disaster risk reduction

Minimum Standards for local climate-smart Disaster Risk Reduction (DRR)

Part II: Guidance note for civil society and governments

This table aims to guide to *civil society organizations* on how they may best support communities to make their DRR programmes climate smart. In addition, it outlines how *government authorities may help create an enabling environment* for implementation of the Minimum Standards at the community level. Both actors are essential for supporting community level resilience.

Theme	Role of civil society organisations (CSO) supporting communities implementing climate-smart DRR	Enabling environment requested from authorities
Information flow and capacity development	<ul style="list-style-type: none"> • Knowledge on changing climate risk is integrated into the CSOs' relevant planning processes • Staff and volunteers at national and provincial levels are able to facilitate dialogue on how natural climate variability (such as El Niño and La Niña, where relevant) and climate change affects their work and can explain the basic causes, trends, projections and impacts of both on the organisations' activities and community programs • Training on the interrelationship between climate change, disaster risk reduction, and the linkages to ecosystem management is provided to all relevant staff and volunteers • CSOs help developing locally relevant information and education material, incl. on impacts of climate change and practical approaches to climate smart DRR • Civil society organizations have an active climate change focal point (at least at HQ level) responsible for organisational capacity building in climate change adaptation and DRR 	<ul style="list-style-type: none"> • Relevant authorities strive to provide, and continuously improve, weather and seasonal forecast information in locally relevant, easy to understand formats based on end user needs – taking into account local perceptions of risk and uncertainty, and the value of local practices in managing risk • Authorities undertake public awareness activities (including within the formal education system) on the links between climate change and disaster risk reduction (CSOs may assist in developing key messages) • Authorities have an active climate change focal point (at least at national and province levels) for capacity building in community-based DRR and climate change adaptation
Project planning and implementation	<ul style="list-style-type: none"> • Civil society organizations provide guidance to facilitate integration of seasonal forecast information and climate risk into community risk assessments and contingency plans • New programs consider a level of "acceptable risk" in project design (incl. physical structures) and incorporate projected trends in climate change – including increased weather variability and shifts in seasonal patterns • 'Early warning – early action plans' for different timescales (days to decades) are defined and promoted to support appropriate community response to changing climate and risks patterns • Successful community level climate-smart, innovative interventions are captured and disseminated for replication, where appropriate 	<ul style="list-style-type: none"> • Local planning and development authorities partner with relevant CSOs to support the development and implementation of climate-smart community DRR plans • Government disaster management agencies, together with CSOs with a disaster management mandate, prepare Early Warning – Early Action contingency planning (emergency response planning) at all levels and coordinated across levels and organisations

Theme	Role of civil society organisations (CSO) supporting communities implementing climate-smart DRR	Enabling environment requested from authorities
Monitoring, evaluation and learning	<ul style="list-style-type: none"> Organisations (with relevant government agencies and knowledge centres) hold regular review meetings to evaluate the integration of climate risk factors into various community-based activities (e.g. risk assessments); lessons learned are used to inform local development planning efforts and documented for wider use (linked to Project planning above) 	<ul style="list-style-type: none"> A mechanism for reviewing disaster risk reduction and climate change adaptation policies are in place, and results are shared with communities and civil society (ideally, communities and CSOs should be invited to participate in policy review and/or hearing processes)
Awareness raising and policy dialogue	<ul style="list-style-type: none"> CSOs provide support to build community skills and confidence to link/collaborate with authorities and other stakeholders responsible for planning and adaptation to changing risk patterns CSOs and communities make use of dialogue opportunities (e.g. meetings, national days for actions, conferences) to inform relevant authorities and agencies of community adaptation needs, and to help shape adaptation policies and resource allocation etc. Partnerships and multi-disciplinary teams of experts in DRR and climate-change adaptation are established (or strengthened) to improve understanding and coordination between these policy areas and to ensure they reflect communities' needs Civil society organizations adopt the 'Early Warning – Early Action' approach to promote forecast-based contingency plans at the community level and beyond 	<ul style="list-style-type: none"> Authorities (and CSOs) organise venues/forums where community, civil society, government and knowledge centres can meet and learn from one another regarding climate change adaptation policy development and local disaster risk reduction and climate change adaptation needs Support and planning mechanisms are <i>flexible</i> and adaptive in order to respond to changing risks, changing governance structures, and future planning needs
